Abstract: The banking sector has experienced substantial transformations as a result of the proliferation of financial technology, commonly known as FinTech. The introduction of these breakthroughs has caused a transition from conventional banking to digital services, bringing forth a range of developments like AI platforms, Blockchain technology, virtual currencies, Robo-advisors, and chatbots. Despite the speedy and easy services offered by FinTech, there are still difficulties regarding trust, security, and data privacy, particularly in nations such as Pakistan. This study explores the integration of Robo-advisors within Pakistan's FinTech sector, focusing on the challenges of trust, security, and data privacy. Chatbots, playing a crucial role in the banking and telecom industries, encounter challenges such as customer skepticism and the potential for cybersecurity threats. Using Grounded Theory and Social Representation Theory (SRT), the study comprehensively examines how chatbots and Robo-advisors in the Pakistani FinTech industry address these challenges. The findings indicate that establishing trust, guaranteeing data security, and enhancing user experience are of utmost importance. Transparent communication, robust security measures, and user-centric design have been identified as critical for building trust and driving adoption. Collaboration with financial professionals, continuous innovation, and user education emerge as crucial answers. The study highlights the significance of transparency and adherence to regulations, while proposing future research avenues to investigate the psychological aspects influencing the adoption of FinTech and the effects of developing technologies. These insights contribute to the growing discourse on FinTech innovation and its potential to enhance financial inclusion in developing economies.

Keywords: Robo-advisors; Trust; Data Security; Data Privacy; Grounded Theory; SRT

1 Introduction

In recent years, the banking sector has witnessed a transformative expansion in financial technologies, commonly called FinTech. This paradigm shift has significantly reshaped traditional banking services. FinTech, or **Financial Technology**, leverages algorithm-driven technology to streamline and automate the delivery of financial services, simultaneously spawning novel investment opportunities and revenue streams through innovative business models [1] [2]. The evolution of FinTech, transitioning from analogue to digital technologies, has predominantly been spearheaded by financial banking institutions. This technological revolution encompasses diverse developments including AI-enabled platforms, blockchain, virtual currencies, crowdfunding platforms, robo-advisors, Insure tech, and central bank digital currency [3] [4]. The rise of FinTech has ushered in an era of rapid, secure, and convenient financial services, increasingly preferred by consumers for transactions [5] [6]. Propelled by advancements in AI, machine learning, and big data analytics, this shift underscores the immense potential and promising future of FinTech in the realm of financial services [7] [8].

Chatbots have become an essential tool for businesses, especially in the banking and telecom sectors, in Pakistan's rapidly growing digital landscape. Their adoption is motivated by the necessity to offer streamlined customer service and manage the growing influx of online interactions. Nevertheless, the incorporation of chatbots raises substantial apprehensions around trust, security, and data privacy. These issues are particularly noticeable in a country such as Pakistan, where the level of digital literacy is still developing, and cybersecurity procedures are in their early stages. Users frequently exhibit reluctance to divulge personal information to automated systems due to concerns about potential data breaches and unauthorized utilization.

Trust is fundamental to the way users engage with chatbots. Establishing this trust is imperative in Pakistan, considering the prevailing distrust towards digital platforms. Companies are improving the human-like interaction skills of AI- driven chatbots to address this issue. Chatbots are being developed to comprehend and reply in local languages such as Urdu by utilizing advanced Natural Language Processing (NLP) and Machine Learning (ML) techniques. It enhances the user experience by providing more personalized and relatable interaction [9] [10].

Furthermore, transparent chatbot operations can establish user trust, explicit communication regarding their functionality, and the presence of visible certificates or endorsements from reputable authorities [11]. The growing emphasis on digitalization across numerous sectors in Pakistan has heightened the importance of security as a primary concern. To address this issue, corporations are incorporating strong encryption techniques and rigorous data protection procedures into their

chatbot systems. To ensure user data privacy, we implement routine security audits, strictly adhere to worldwide cybersecurity standards, and comply with Pakistan's regulatory framework for data protection. In addition, providing users with information about secure processes and the steps taken to safeguard their data is crucial in reducing concerns about data privacy. This paper investigates how chatbots in Pakistan's FinTech sector address trust, security, and data privacy challenges, providing practical solutions to overcome these barriers.

The adoption of chatbots in Pakistan's FinTech sector holds immense potential for advancing financial inclusion. However, trust deficits, security vulnerabilities, and data privacy concerns hinder widespread adoption [12] [13]. Resolving these issues is crucial for building confidence in digital financial services and fostering a more inclusive digital ecosystem in developing nations. This study uniquely explores the interplay of cultural, linguistic, and regulatory factors in Pakistan that impact chatbot adoption in FinTech. Unlike prior research, it integrates Grounded Theory and Social Representation Theory to offer a nuanced understanding of trust-building mechanisms in a developing economy.

This research faced challenges in accessing relevant participants, given the nascent stage of chatbot adoption in Pakistan, and in navigating the socio-cultural complexities influencing user perceptions.

The future of chatbots in Pakistan depends on achieving a harmonious equilibrium between technology progress and user-centered considerations. Advancing chatbot technology in a secure and trustworthy manner will depend on the continuous enhancement of AI algorithms and the establishment of a robust legislative framework dedicated to AI and data privacy. Furthermore, using frequent feedback loops with users to comprehend their issues and customize chatbot features accordingly will guarantee that these digital assistants are not only technologically proficient but also in harmony with Pakistan's cultural and social context. With the increasing digital awareness, chatbots are expected to play a crucial role in the digital ecosystem, revolutionizing the way businesses engage with their customers. In summary, this study offers actionable insights and a proposed framework for building secure, trustworthy, and culturally relevant chatbot systems, paving the way for greater adoption of FinTech innovations in Pakistan.

The remainder of this paper is organized as follows: Section 1 is the introduction and reviews the theoretical background of related work. Section 2 details the research methodology and data analysis process. Section 3 presents the results and findings on trust, security, and privacy challenges, proposes a framework for addressing these issues. Finally, Section 4 provides conclusions and suggests directions for future research.

1.1 Theoretical Background

Chatbots in the realm of financial technology (fintech) are a notable advancement,

aligning with the overall trends of automation and digitization in the Fourth Industrial Revolution [14]. Initially conceived as basic automated responders, chatbots have advanced into sophisticated instruments driven by artificial intelligence (AI) and machine learning (ML)[15]. They possess the ability to proficiently manage intricate customer service responsibilities, such as addressing financial queries, overseeing account administration, and facilitating transactions [16]. The incorporation of chatbots into fintech corresponds to the growing inclination of consumers towards digital-first engagements, wherein convenience and expediency take precedence [17]. Trust is a fundamental and essential aspect of the financial industry, particularly in fintech, where digital interfaces are used instead of human contacts [1]. In this particular setting, chatbots encounter the difficulty of establishing and preserving customer confidence. Research suggests that users' trust in chatbots can be greatly influenced by their perceived intelligence and resemblance to humans [18]. Fintech businesses prioritize improving the cognitive capacities of chatbots, aiming to make them prompt and more instinctive. The trust is influenced by the cultural background, especially in regions such as Pakistan. Adapting chatbots to comprehend and engage in regional languages and cultural norms can greatly reduce the trust deficit [19].

Due to the sensitive nature of financial data, security is of utmost importance in the field of fintech. Chatbots provide distinct security concerns as a result of their ease of access and the enormous volume of data they handle. To tackle these issues, fintech organizations are implementing sophisticated encryption techniques, safe data storage solutions, and stringent authentication procedures within chatbot systems [20]. Moreover, adherence to regulations, particularly in the areas of data protection and privacy, is of utmost importance. For fintech organizations in Pakistan, it is essential to adhere to international standards and take into account local regulatory frameworks when utilizing chatbot technology [21].

Data privacy in the finance industry, specifically in the functioning of chatbots, is an additional crucial domain [22]. Transparent data regulations and user permission methods are necessary to address users' concerns regarding utilizing and disseminating their data through chatbots. Increasingly, fintech organizations are adopting the practice of including privacy by design in chatbot creation. This approach prioritizes the protection of user data as a fundamental concept. Furthermore, providing users with knowledge about data privacy policies contributes to the establishment of trust in chatbot interactions [23, 24]. So, the following research question can be constructed for further research analysis.

RQ1 How do chatbots address the problems of trust, security, and data privacy?

The subsequent section presents the findings, highlighting the key challenges and solutions identified through qualitative analysis.

2 Methodology

In this study, the qualitative data analysis followed three distinct phases: open coding, where key terms and concepts were identified; axial coding, which grouped similar codes to discern patterns and relationships; and selective coding, which consolidated categories into overarching themes. Using NVivo software, these phases ensured a systematic and thorough exploration of the data, allowing for a grounded understanding of the challenges and proposed solutions [25]. This qualitative research approach is particularly suited to our aim of developing a deep understanding of complex phenomena directly from the data.

2.1 Participant Selection and Snowball Sampling

The study involved 34 participants, selected using snowball sampling, a technique well-suited for accessing specialized and interconnected populations like fintech professionals. Starting with a few critical informants identified through professional networks and targeted LinkedIn searches, the sampling expanded as these initial participants referred additional interviewees within their networks. Grounded Theory [26] is a systematic methodology in the social sciences involving the construction of theories through methodical gathering and analysis of data. It is particularly effective for exploring areas with limited existing research or theoretical frameworks, making it apt for our study on the relatively new application of chatbots in fintech. Semi-structured interviews were used to collect data, allowing for open-ended responses while guiding the conversation towards specific topics. This format facilitated rich, detailed insights into the experiences and perceptions of fintech professionals regarding chatbot technology. Interview guidelines were carefully crafted to align with Grounded Theory principles, focusing on generating rich, qualitative data that could inform the development of new theories. The guidelines included open-ended questions to explore how chatbots are being used in fintech, the challenges and strategies related to trust, security, and data privacy, and the overall impact of chatbots on the fintech industry.

2.2 Data Analysis Process

Consistent with the principles of Grounded Theory, the data analysis process entailed a constant interaction between gathering and processing data. The transcribed interviews underwent coding, with the codes being consistently compared and refined to discern significant themes and patterns.

The study utilized QSR NVivo software to code and conduct in-depth textual analysis, which is essential for organizing and analyzing qualitative data in Grounded Theory research. The analysis was organized into three distinct phases [27]: During the **open coding phase**, the main objective was to find important terms and concepts from the interview transcripts. **Axial coding**, the second phase, involved categorizing comparable concepts to facilitate the recognition of patterns and connections within the data. **Selective Coding**: The concluding stage was consolidating these categories into a cohesive coding hierarchy, which directed the meticulous examination of the data (Figure 1).

Figure 1
World Cloud

2.3 Open Coding Phase

Open Coding Phase Nodes Distribution

Further themes were identified in the open coding phase. At the initial stage of 34 interviews several codes were made later it was categorized in a few codes and then they were aggregated to themes.

Table 1
Challenges behind the adoption of Robo-Advisors in Fintech identified from the literature.

Sr. No	Challenge	Sources
1	Trust	[28-32]
2	Data Privacy	[28, 33, 34]
3	Security	[33, 35]

The emergence of Robo-advisors, which are automated investment platforms that employ algorithms and technology to offer tailored financial guidance, has fundamentally transformed the investment industry [36]. Nevertheless, the extensive utilization of Robo-advisors has been impeded by apprehensions regarding trust, data privacy, and security, despite their capacity to democratize financial planning and enhance accessibility [37]. These worries arise because of

the delicate nature of financial information and the possibility of being misused or compromised it.

The question of trust is a fundamental difficulty in the adoption of Robo-advisors. Investors frequently have concerns about relying on algorithms and software systems to manage their finances, especially when dealing with large amounts of money [38]. Acquiring consumer trust necessitates creating a reputation, showcasing transparency, and offering explicit explanations of investment reasoning and tactics. Robo-advisors gather comprehensive personal and financial information from users in order to customize investment suggestions [39]. The presence of this data raises substantial privacy concerns, as it holds considerable value for identity thieves and other harmful individuals. To guarantee data privacy, it is necessary to implement strong security measures, establish explicit data handling policies, and provide transparent information about data-gathering activities.

Safeguarding user data from unauthorized access, tampering, or disclosure is of utmost importance when it comes to financial information. Robo-advisors are required to follow strict security measures, which involve implementing encryption, access controls, and vulnerability assessments. Regular system inspections and evaluations are crucial for detecting and resolving any security weaknesses.

Table 2
Solutions behind Challenges to adoption of Robo-Advisors in Fintech identified from literature

Sr. No	Solutions	Sources
1	Educate	[36-38]
2	Transparency	[38-40]
3	Regular System Check	[41, 42]
4	Advancement in Encryption	[43, 44]

Several approaches may be taken to overcome these obstacles and encourage more people to use Robo-advisors: It is critical to inform investors about the pros, cons, and dangers of Robo-advisors [45]. Disclosure of data privacy practices, algorithmic decision-making procedures, and investment strategies must be made transparent. Disclosure of Robo-advisors' investing strategies, data-gathering procedures, and fee structures is required [46]. Equally important is the unequivocal declaration of any possible conflicts of interest, including any revenue-sharing agreements with investment providers. To find and fix security flaws, it is necessary to conduct system inspections and audits regularly. It is important that all aspects of the Robo-advisor, including its infrastructure, third-party service providers, and data and software systems, are thoroughly examined [47].

Secure enclaves and homomorphic encryption are two new forms of encryption that have the potential to significantly improve the security of sensitive financial data [48]. These technological advancements lessen the likelihood of data breaches and illegal access by enabling data processing and analysis without jeopardizing its confidentiality. Academic literature must prioritize the issues of trust, data privacy,

and security as they pertain to the adoption of Robo-advisors. To investigate these problems, assess the efficacy of potential remedies, and influence business policies and government oversight, researchers and academics are indispensable. Academic institutions may help build Robo-advisor systems that are safe, reliable, and extensively used by performing thorough research, sharing their results, and collaborating with industry players [38].

3 Results

3.1 Challenges and Solutions Considering Robo-Advisors in Fintech

Interpreting the results of qualitative research is somewhat emerging as a way to discuss the various challenges and their solutions involved in the upcoming technological advancements in fintech. While analyzing the interviews, the study categorized these challenges. Subsequently, the study discussed the sub- challenges and proposed solutions from thematic perspectives. This will help us to understand why consumers are not accepting Robo-advisors.

3.2 Data Security

Robust security protocols are of the utmost importance in the fintech industry. This need becomes apparent when looking at the results of the qualitative interviews with industry experts. The varied and complex nature of fintech security is shown by the insights gained from these interviews, which shed light on several issues and their solutions. According to Interviewee 11, one of the main issues is data security, which involves safeguarding sensitive consumer information. The suggested method calls for routine security assessments and upgrades to protect client data from ever-changing cyber dangers. The significance of constantly monitoring and upgrading security procedures to protect sensitive information is widely acknowledged in the business, and this accords with that view.

The security and privacy of important financial records is another major concern voiced by Interviewees 2 and 12. Protecting this information is essential to keeping customers' faith in your brand, and it's also a technical consideration. The proposed approach emphasizes the importance of protecting client data, showing a deliberate effort to earn and keep confidence through trustworthy security measures. According to Interviewees 2, 3, and 4, the prevalence of cyber dangers and data breaches is further highlighted in the interviews. Interviewee 4 suggests using many layers of protection to combat this. The current cybersecurity techniques align with this suggestion, implying that a layered defense mechanism is better at reducing the likelihood of cyber assaults.

Two more important interviewees brought up the issue of identity verification, which is a major hurdle. According to the proposed approach, we must be vigilant and constantly innovate to authenticate user IDs. This method is reflective of the ever-changing nature of financial technology, where new security measures are always being developed to keep up with increasingly complex fraud schemes. Finally, Interviewee 9 stresses the significance of a safe system. The suggested approach involves reaching out to a wide audience, which suggests a holistic plan that incorporates education, community involvement, and technical solutions to enhance security.

The intricacy of fintech security concerns is highlighted by these findings from the interviews when taken as a whole. Additionally, they display the many creative approaches experts are contemplating to tackle these problems, which helps improve security measures in the financial technology industry. The present status of fintech security and how to steer future changes in this dynamic area may be better understood with the help of this analysis.

Table 3
Data Security Challenges and Solutions from Interviews

Challenge	Category	Solution
Protecting sensitive customer information (11)	Data Security	regular security audits and updates (11)
Security of sensitive financial data (12) (2)		confidentiality and integrity of customer (12)
Cyber threats and data breaches (2)(3)(4)		multi-layered security protocols (4)
Identity verification (24) (25)		constant vigilance and innovation (24)
Secure infrastructure (9)		Extensive outreach (9)

“The integration of chatbots in financial services poses challenges like data security and privacy. Protecting sensitive customer information and ensuring secure interactions are our top priorities.”

(Interviewee 11)

“The main challenge was ensuring the security of sensitive financial data handled by the chatbots. It was crucial to protect against cyber threats and data breaches. One challenge has been keeping up with the evolving data privacy laws and updating our chatbots accordingly.” *(Interviewee 2)*

3.3 Privacy

The incorporation of chatbots poses a myriad of complicated issues in the ever-changing field of financial technology (fintech), calling for solutions that are just as proactive and advanced. According to several interviews, these problems mostly

include maintaining secure connections, keeping up with rapidly evolving data protection standards, and protecting client data. The assurance of privacy in conversations provided by chatbots is a key concern, as brought up by Interviewees 11 and 4. Respondent 11 suggests cutting-edge encryption software as a solution, highlighting the need for sophisticated cryptographic techniques to safeguard private data. Further, to quickly detect and resolve possible security breaches, Interviewee 4 proposes real-time monitoring of chatbot conversations.

Another key impediment cited by Interviewees 11, 12, 2, 24, 26, and 29 is the issue of keeping up with the continually increasing data privacy standards. Interviewee 11 proposed a solution highlighting an agile compliance approach through continuous monitoring and regular updates to data protection processes.

Interviewee 12 agrees and emphasizes the need to keep an eye on new laws and regulations and ensure everything is up to date. To successfully traverse the regulatory landscape, interviewee 29 stresses the importance of heavily investing in research and development. In addition, as stated by Interviewee 6, stringent data security procedures are necessary to safeguard client data. Building trust and confidence in fintech services relies on this strategy, which is essential for keeping client information secure and private.

Interviewee 26's thoughts illuminate the larger issue of innovation and adaptation in fintech regarding the necessity of integrating chatbots seamlessly with multiple corporate systems and catering to clients' varied expectations. Deploying chatbots in a diversified and worldwide banking environment is complex and multifarious, as Interviewee 29 points out while discussing the difficulties of keeping up with the banking sector's fast technical and legal changes.

Finally, there are a lot of problems with integrating chatbots into the financial industry, and a lot of creative and quick fixes are needed. By incorporating state-of-the-art encryption technology, real-time monitoring systems, regularly revising data protection policies, and allocating resources to R&D, these solutions demonstrate an all-encompassing and proactive strategy for handling the problems associated with chatbot integration in financial services, including data security, privacy, and regulatory compliance.

Table 4
Privacy Challenges and Solutions from interviews

Challenge	Category	Solution
Ensuring secure interactions (11)(4)	Privacy	latest encryption technologies (11) real-time monitoring (4)
Rapidly changing data privacy regulations (11)(12) (2)(24)(26) (29)		Continuous monitoring and updating of our data protection practices (11)
Protecting customer data (6)		ongoing monitoring of legal developments and regular system updates (12) Heavily invest in R & D (29)

“Additionally, ensuring our platform integrates seamlessly with various business systems and meets the diverse needs of our clients requires constant innovation and adaptability.”

(Interviewee 26)

“The primary challenges include keeping up with the rapid pace of technological advancements and regulatory changes in the banking sector. We've also had to address the diverse and evolving needs of banks in different regions.”

(Interviewee 29)

3.4 Trust

A major obstacle to establishing and sustaining customer confidence in the fintech industry is the rise of Robo-advisors and other digital-only platforms [49]. Numerous factors contribute to the complexity of this problem, including the necessity to accommodate a wide range of financial requirements, guarantee the security of online transactions, and combat widespread low levels of financial and technological literacy. Education, openness, and constant innovation are the cornerstones of the ideas put up by the respondents to resolve these trust-related problems. According to Interviewee 13, gaining confidence in an entirely digital environment is a major obstacle, especially regarding financial investments. One important tactic to address this is to educate customers. As pointed out by Interviewee 14, it's not only about giving them knowledge; it's also about constantly interacting with them. To help people understand and trust digital platforms, providing them with instructional resources like these is crucial.

Respondent 17 highlights the difficulty of accommodating individuals varied financial demands and habits. Providing instructional materials and assistance is at the heart of the proposed solution, which allows for the customization and improvement of products to cater to specific user demographics. A shift towards a paradigm that is more user-centric, where services are customized to meet individual tastes and needs, is indicated by this approach. Providing pertinent resources and instructional content is key to resolving the conventional banking system trust difficulties brought up by Interviewees 22, 8, and 10. As pointed out by Interviewee 34, this is vital for connecting conventional and online banking. Making resources available for customers used to more conventional banking processes can help smooth the way.

Transparency, highlighting security features, and educating customers are ways to approach the difficulty of generating confidence in digital transactions, as stated by Interviewee 23. Customers might feel more comfortable and confident using digital platforms for financial transactions if the security measures are explained to them and they are educated about the procedures involved. Interviewee 24 brings up the difficulty of keeping up with evolving financial fraud tactics and proposes a solution that involves continuous monitoring and inventiveness. This shows that fintech

platforms and Robo-advisors need to be flexible to fight emerging types of financial crime. Another major obstacle to trust-building is a lack of knowledge about money (Interviewees 27, 7, 9) and technology

(Interviewees 30, 9). To provide consumers with the necessary knowledge and confidence to utilize digital financial services efficiently, it is vital to implement the offered solutions, which include community participation, instructional programs, and customer education activities.

Lastly, the lack of awareness is addressed through various educational programs, as brought up by Interviewees 5 and 7. These programs aim to provide the groundwork for trust by making digital financial instruments more accessible and easier to use. Establishing confidence in fintech's Robo-advisors and other digital financial platforms ultimately calls for a concerted effort focusing on education, openness, and innovation. Fintech organizations may consistently create and sustain trust across a broad user base by educating consumers, providing specialized resources, exhibiting security features, and adjusting to changing demands and technology. In today's increasingly digital environment, the acceptance and expansion of digital financial services are dependent on this confidence.

Table 5
Trust Challenges and Solutions from Interviews

Challenge	Category	Solution
digital-only platform (13)	Trust	educating consumers (14) continually educating our users (13)
Adapting to Diverse Financial needs (17)		offering educational resources and support (17)
To address Traditional financial system trust (22)(8)(10)		Providing relevant Tools (10) Education (22) (8)
Digital Transaction trust (23)(33)(34)(6)(11)		Transparent (11)(13) showing security features (23) Customer Education (33) (34) (6)
Changing Financial Fraud Techniques (24)		constant vigilance and innovation (24)
AI models unbiased (25)		
Lack of financial literacy (27)(7)(9)		community engagement and educational programs (27) (7)(9)
Lack of Digital Literacy (30)(9)		Customer Education Program (30)(9)
Lack of Awareness (5)(7)		educational initiatives (5) (7)

“One of the main challenges has been building trust in mobile banking, especially among those who are more accustomed to traditional banking methods.”

(Interviewee 34)

“One major challenge is building trust in a digital-only platform, especially when it comes to investments.”

(Interviewee 13)

“A very important challenge is adapting to our users' diverse financial needs and behaviors, which we meet by continually refining and personalizing our offerings.”

(Interviewee 17)

“One of the main challenges has been building trust in digital transactions, especially among users who are accustomed to traditional payment methods. Another challenge is keeping pace with the rapidly changing technology in fintech, which we meet through continuous innovation and updates.”

(Interviewee 23)

3.5 Information System Integration

The fintech industry's integration of chatbots and Robo-advisors calls for a thorough strategy to integrate information systems [38]. According to qualitative research, this problem encompasses a wide range of issues, including but not limited to fast technological development, managing customer expectations, user interface design, user experience, technology complement, and keeping up with fintech trends. Within this framework, the solutions put forth by interviewees emphasize the significance of ongoing innovation, teamwork, and putting the user first. A key to open banking's acceptability, according to Interviewee 14, is the difficulty of merging different financial systems. The proposal being put out calls for a partnership between financial institutions and ongoing technological progress. By taking this tack, we can ensure that chatbots and Robo-advisors are compatible with all the features of various financial systems and that integration is smooth.

Respondents 15, 19, 20, 24, 32, and 33 all pointed out that making the UI easy to use is another major obstacle. Interviewees 19 and 20 suggest increasing the variety of tasks that chatbots can do, while Interviewee 24 suggests constantly innovating, Interviewee 32 suggests enhancing services based on user feedback, and Interviewee 33 suggests demonstrating how convenient they are. In order to increase consumer acceptance and trust in these technologies, these tactics are focused on improving the user experience by making it more intuitive and efficient. Focusing on the platform's design and usability, interviewee 16 emphasizes the relevance of user experience across different capabilities. This shows that the importance of user experience in increasing engagement and happiness with the product has been recognized.

According to Interviewee 18, technology complements make chatbots and Robo-advisors more successful by utilizing financial professionals. This approach proposes a combined use of human and technological knowledge to deliver an all-

encompassing service. Respondents 21 and 8 also mentioned that keeping up with fintech developments was difficult. Maintaining the platforms' relevance and innovation in a sector that is always changing requires a solution that combines continual research and development.

Respondents 21, 22, 31, and 32 all agreed that meeting customers' expectations is no easy feat. Answers include working closely with clients (Interviewee 21), becoming involved in the community (Interviewee 22), investing in technology (Interviewees 31 and 32), and improving services based on consumer input (Interviewee 32). These methods stress the need to listen to and meet customers' demands. Discussing the difficulty of keeping up with quickly evolving technologies, Interviewee 23 joins Interviewees 26, 28, 29, 30, 32, and 34. A number of potential solutions have been put up, including providing ease and efficiency (Interviewee 23), investing heavily in R&D (Interviewee 29), and providing extensive functionality without sacrificing user experience (Interviewee 28). If these tactics are implemented, the platforms will continue to be state-of-the-art, user-friendly, and adaptable.

Interviewee 31 pointed out that a talented staff committed to digital platform maintenance and enhancement is the key to scalability. This approach highlights the need to have a competent and flexible staff to guarantee the platforms can grow successfully as user demands and technology change. Finally, several issues pertaining to information system integration must be resolved for fintech chatbots and Robo-advisors to be integrated successfully. Important issues include adapting to technology changes, managing consumer expectations, scalability, and user-centric design. Other solutions involve collaborating with financial professionals and continuously innovating. All of these methods work together to boost confidence and acceptability among fintech users, which is crucial for the industry-wide deployment of these technologies.

"Another challenge is educating consumers about the benefits and safety of open banking, which we are tackling through outreach and user education programs."

(Interviewee 14)

Table 6
Information system Integration Challenges and Solutions from Interviews

Challenge	Category	Solution
Various financial systems (14)	Information System Integration	continuous technological innovation & Collaboration with financial institutions (14)
User-friendly interface (15)(19)(20)(24)(32)(33)		expanding and diversifying the range of tasks (15) intuitive design and navigation (19) (20) constant innovation (24) feedback-driven service enhancements (32)

		Demonstrating convivence (33)
User experience across different functionalities (16)		platform's design and usability (16)
Technology Complement (18)		financial experts (18)
Fintech Trends (21)(8)		continuous research and development (21)(8)
Customer Expectation (21)(22)(31)(32)		Close Collaboration (21)
Rapidly changing technology (23) (26)(28) (29) (30)(32)(34)(8)		Community engagement(22) Continue Investment in Technology (31) feedback-driven service enhancements (32)
Scalability (31)		Convenience and efficiency (23) comprehensive features without compromising on user experience (28) Invest Heavily R & D and Learn Continually (29) Customer Education Program (8) (30) Continues Investment in technology (32)(34)

Conclusions, Discussion and Future Directions

This qualitative research study utilized grounded theory and the analytical capabilities of NVivo to conduct a comprehensive analysis of 34 interviews. This study aimed to examine the challenges related to the implementation and assimilation of chatbots and Robo-advisors in the financial technology industry. The research has successfully identified and advanced several important subjects. The subjects discussed encompass safeguarding personal information and data, fostering trust in digital platforms, addressing the intricacies of integrating information systems and adapting to the dynamic nature of the financial landscape [50].

These findings significantly enhance the ongoing scholarly discourse on the topic of fintech innovation and user acceptance. They align with the viewpoints of prominent industry scholars, such as [51], who underscore the significance of trust and security. The proposed solutions, such as implementing transparent communication strategies and leveraging advanced encryption techniques, are feasible within the context of Pakistan's FinTech sector. However, their success depends on stakeholder collaboration, regulatory support, and sustained technological innovation.

The study has sparked a detailed discussion that illuminates the intricate connection between technical expertise, adherence to regulations, and the crucial importance of user experience in determining the acceptance of these contemporary financial technologies. Wang, et al. [52] highlight that safeguarding sensitive customer information is a critical problem in the financial technology sector. The emphasis on robust data security measures aligns with this goal. Furthermore, the study

emphasizes the significance of ongoing innovation and adjustment, aligning with discoveries [53]. This is done to tackle the ever- changing technical and regulatory landscape. Furthermore, it underlines the need to adopt a user-centric strategy, which prioritizes user education and participation as the essential elements in establishing trust and acceptance. This concept is substantiated by research conducted by Vrontis *et al.* [54].

This study is limited by its reliance on a small sample size and the snowball sampling method, which may introduce biases, by over-representing certain perspectives. Additionally, the findings are specific to Pakistan's socio-cultural and regulatory environment, limiting their applicability to other contexts.

This research sets the stage for several new areas of study, with a focus on future prospects. Thompson, *et al.* [55] advocate for employing longitudinal studies as a methodological approach due to their capacity to provide a more comprehensive understanding of evolving consumer views and business practices within the field. Conducting a comparative study in different cultural and regulatory settings, as suggested by Lim and Teo [56], might uncover important contextual factors that influence the adoption of these technologies. Vrontis, *et al.* [57] argue that the increasing impact of emerging technologies like artificial intelligence and blockchain on the effectiveness and adoption of chatbots and Robo-advisors is a promising area for further investigation. Furthermore, doing a comprehensive examination of the psychological factors that impact user acceptance, building upon the theoretical frameworks proposed by Zhao and Bacao [58], would yield valuable insights into the cognitive and emotional dimensions of technology adoption. Ultimately, employing quantitative methods to validate and expand upon this study's qualitative discoveries can provide a more comprehensive understanding of the phenomena [59].

In conclusion, this work underscores the importance of addressing trust, security, and privacy challenges to foster the adoption of Robo-advisors in Pakistan's FinTech sector. By employing user-centric design, transparent communication, and robust data protection measures, FinTech companies can enhance user trust and expand financial inclusion. The study also highlights the need for longitudinal research and cross-cultural comparative analyses to better understand the evolving landscape of FinTech adoption.

Overall, this study not only provides valuable insights into the current challenges and approaches in the fintech sector regarding the incorporation of chatbots and Robo-advisors but also opens up several opportunities for further research.

The anticipated future initiatives will greatly enhance our comprehension of this rapidly advancing and crucially important subject.
